

USER GUIDE

Version 1.1

WHAT THIS APP IS FOR

Neverwinter Forge is a focused image-generation front end for creating game-art references, miniature statue concepts, modular outfit sheets, object concepts, bas-relief plates, and post-production upscales without manually rebuilding long prompts.

CURRENT TESTING RECOMMENDATION

OpenAI has produced the most consistent front/back matching and prompt adherence in current testing. Gemini remains available and can produce strong results, especially when users want to experiment with Gemini-specific image models.

DEVELOPER NOTE

Some local workflows, especially depth and normal maps through ComfyUI Desktop, are advanced features and may continue to evolve.

QUICK START

START HERE

- Open Neverwinter Forge and wait for the splash screen to finish.
- Choose Mock, Gemini, or OpenAI. Paste the matching API key for Gemini or OpenAI.
- Choose a preset, or use Open Prompt for a direct custom generation.
- Load an input image for image-to-image workflows, or type a subject for text-to-image workflows.
- Set size, aspect ratio, and quality controls when they are available.
- Click Generate. The result appears in Output and auto-saves beside the running app.

PROVIDER GUIDANCE

- OpenAI is recommended when view matching and strict prompt adherence matter most.
- Gemini is optional and useful for supported model experiments, but second-view matching can vary.
- Mock mode is for interface testing only and does not spend API credits.

OUTPUT FOLDER

- Generated images and matching metadata JSON files are automatically saved.
- Use Open Outputs Folder to open the folder used by the currently running EXE.
- Save Browser Copy is a manual browser download option, not the primary autosave path.

MAIN GENERATION SCREEN

Preset image-to-image workflow with numbered click targets.

- ① Provider selector: choose Mock, Gemini, or OpenAI.
- ② Preset Prompts: choose the workflow template.
- ③ Input panel: load the source image.
- ④ Output panel: review the generated result.
- ⑤ View buttons: create follow-up back or angled views when available.
- ⑥ Autosave panel: confirms the saved output file and metadata.

PRESET + MISC

PROMPT MODES

- Preset + Misc: use the preset prompt and add a small extra instruction.
- Preset Only: run the preset cleanly with no extra direction.
- Misc Override Only: intentionally let your custom prompt drive the generation.

D&D MINIATURE

- Use a clear full-body character reference when possible.
- Generate the front miniature first.
- Use Back View or 3/4 View after the front result is acceptable.
- OpenAI is currently preferred for consistent follow-up views.

Example: input reference converted into a miniature statue output.

MODULAR OUTFIT

The modular outfit presets convert outfit references into clean T-pose style outfit renders. Male and female presets use different locked silhouette references.

Male front

Male back

Female front

Female back

- Review generated outfits for unwanted cloaks, heraldic symbols, or identifiers.
- If an unwanted item remains, rerun with a short Misc instruction to remove it.

OBJECT CONCEPT

Object Concept is a text-to-image workflow for clean orthographic prop references. It is useful for AI-to-3D, Blender cleanup, game asset creation, and Substance Painter reference work.

Object front

Object back

HOW TO WRITE THE OBJECT

- Name the object plainly.
- Add material, era, shape language, and intended use.
- Generate the front first, then use back or side view when needed.

BAS-RELIEF

Bas-Relief Concept text-to-image workflow.

- 1 Text prompt: describe the bas-relief subject or scene.
- 2 Output preview: generated carved plate.
- 3 Canvas controls: choose model, output size, and aspect ratio.
- 4 Autosave panel: confirms image and metadata saved to outputs.

From text

OPEN PROMPT

Open Prompt is the flexible no-preset mode.

- 1 Open Prompt button activates direct prompt generation.
- 2 Prompt field holds your custom instruction.
- 3 Output preview shows the result.
- 4 Provider settings control model, size, aspect ratio, quality, and estimated cost.
- 5 Generate Open Prompt starts the job.

UPSCALER

UPSCALER

Upscaler runtime is installed.

Depth / Normal Maps

Depth / Normal Maps ready.

Upscaled 2x locally. Auto-saved to output: 20260526-005238-304633-generated-output-upscaled-2x.png.

Local 2x and 4x post-production upscaling.

- 1 Use Current Output loads the last generated image.
- 2 Upscale 2x or 4x starts local upscaling.
- 3 Comparison area shows original and upscaled versions.
- 4 Save Upscaled lets the user save the upscaled image manually.
- 5 Local status confirms install and processing messages.

DEPTH / NORMAL MAPS

Local ComfyUI depth and normal map workflow.

- ① Refresh checks the local ComfyUI workflow status.
- ② Input preview shows the image being processed.
- ③ Model dependencies can be expanded when troubleshooting.
- ④ Generate Depth / Normal Maps starts the local workflow.
- ⑤ Depth result is the grayscale height/depth-style output.
- ⑥ Normal result is the RGB normal map output.
- ⑦ Save buttons manually save the generated maps.

TROUBLESHOOTING

DEPTH / NORMAL MAPS

- This is a local workflow that depends on ComfyUI Desktop.
- Run `install_depth_models.bat` to install or check the expected model and node files.
- Start ComfyUI Desktop before running depth or normal maps.
- Use Refresh or the dependency panel to check what Neverwinter Forge can see.

COMMON FIXES

- No API output: confirm the selected provider has the matching API key.
- Wrong style: try Preset Only to remove accidental Misc instructions.
- Aspect ratio ignored: choose aspect ratio before pressing Generate.
- Second view does not match: regenerate from the best front result and prefer OpenAI for view matching.
- No output folder visible: click Open Outputs Folder. The active app creates outputs beside the running EXE.
- ComfyUI offline: launch ComfyUI Desktop first, then refresh the local tool status.
